

# Handling facilities, a tool to achieve animal welfare and increase productivity

Knowing the needs and demands of cattle producers in the South American Chaco, we focused on the difficulties they face on a daily basis when working cattle without the necessary infrastructure and management facilities.

Argentina / Bolivia / Paraguay

## Cattle handling facilities and infrastructure

### The implemented initiative

It is estimated that the infrastructure requires a high investment cost, but it is necessary to make the cost-benefit ratio, since each kilogram of muscle produced by the farmer demands that all attention be paid to the treatment of his cattle and where they are moved in the establishment. Investments made in the purchase or improvement of rural facilities have a convenient

amortization, since the materials used have a very long life, which allows the invested capital to have a positive cost-benefit ratio. Maintenance costs are also minimal in relation to their frequency and cost, and in most cases these tasks are even carried out by the farm personnel themselves.

## Efficient use of available resources

### The technological solution

Inputs from the field or from the forest, such as poles, can be used in the construction of the management facilities, thus making a rational and efficient use of

these resources and at the same time reducing investment costs.
